The subject matters of claims 1-23 are neither described in any of the documents cited in the ISR nor obvious to a person skilled in the art.

Documents 1 and 3 respectively describe a method for producing a block copolyimide excellent in solubility in polar solvents, obtained by letting (1) a dianhydride of an acid other than a tetracarboxylic acid and (2) an aromatic diamine react, in the presence of an acid catalyst, with an oligomer obtained as a reaction product using a tetracarboxylic acid and a diamine as ingredients. Furthermore, documents 1 and 3 also describe the constitution, in which the composition having the said block copolyimide dissolved in a polar solvent is used in such applications as electric and electronic materials. Moreover, document 1 describes (1) a block copolyimide solution composition obtained by using an aromatic diamine having a hydroxyl group and amino groups, as another aromatic diamine, and (2) a production method thereof.

However, document 1 neither describes nor suggests the production of an oligomer as a reaction product obtained using a tetracarboxylic acid and a diamine as ingredients, in which pyromellitic acid is used as the tetracarboxylic acid while diaminotoluene is used as the diamine. As described, for example, in document 2, pyromellitic acid is used considering, for example, stiffness and linearity, but in view of, for example, solubility, it is not generally used in a polyimide solution. The invention of the present application employs (1) a combination of it with a specific diamine and (2) a specific production process, for providing a polyimide containing a pyromellitic acid soluble in a polar solvent. So, it is considered that the invention of the present application has a remarkable working effect compared with the prior art.
